

500 Onsite Workshops

Your staff will come away from training with knowledge and skills, but will they have the confidence to apply that new knowledge in a real-world environment? An onsite workshop can accelerate your ability to be self-sufficient with the Trox Transformation Platform and produce real work product at the same time. In the spirit of teaching you to fish for yourself, an experienced Trox trainer or consultant will work with your developers as they create and deploy projects in your environment. Your staff is guided in applying what they have learned in the classroom to real issues in your real environment. Your organization will gain new development work product.

WORKSHOP PROCESS

When scheduling a workshop, you and the trainer will jointly work to define the scope and objectives of the projects that will be the focus of the workshop, including what specific work product you hope to complete as well as the learning objectives for the participants. In the workshop, the participants are expected to do the work, under supervision and guidance of an experienced trainer. While we can not guarantee that the work product will be completed in the allotted time, our goal is to make sure the scope and objectives are realistic given the workshop timeframe and skills of the participants.
